ostract Abstract:
ie combination of the Internet of Things (IoT) and Adaptive Machine Learning (AML) presents significant opportunities
ocument Sections for precision agriculture by allowing real-time observation, flexible decision-making, and forecasting analyses. This
udy explores the development of an adaptive ML model for smart agriculture systems, focusing on efficient pest
Introduction detection and predictive yield analysis. The suggested models intend to enhance resource efficiency and minimize
Literature Review environmental effects by incorporating diverse data sources such as IoT-enabled sensors, satellite images, and past
gricultural records. The research highlights the design of scalable, interpretable, and cost-effective ML algorithms
. Methodology tailored for diverse agricultural landscapes. These systems address critical challenges such as real-time data
. Results and Discussion processing, pesticide optimization, and ethical concerns related to data privacy. The findings contribute to advancing
stainable and intelligent farming practices, providing a foundation for future innovations in precision agriculture.

Introduction
ore Like This Machine Learning (ML) and the Internet of Things (IoT) are transforming traditional farming by improving efficiency,
stainability, and problem-solving. Smart agriculture uses these technologies to boost productivity and tackle key
allenges. However, traditional farming methods often struggle with timely pest detection, inefficient resource
gn in to Continue Reading
ilization, and limited responsiveness to environmental changes. This research explores how adaptive ML models,
mbined with IoT, can improve pest detection, enhance predictive analysis, and optimize resource use—offering
scalable solution to these persistent agricultural problems..
